What is a Logic Bomb?

A logic bomb is a piece of code designed to preform a certain (possibly malicious) function within your computer. "Time Bombs" are also a type of logic bomb. Time bombs are usually a Trojan virus that has been programmed to initiate on a certain date.

What does a Logic Bomb do?

A logic bomb performs a pre-programmed action when certain conditions are met. These actions are not always malicious, for example an employee may set a logic bomb so if they are not at work for a month, their files automatically delete. A malicious logic bomb, however, may start deleting files on a certain date, or it may even prevent you from logging onto your computer!

How are they spread?

Logic bombs do not spread. They are designed to stay on one computer and one computer only.

How do I protect my PC?

Since you may not know that you have a logic bomb within your PC, the only real precaution you can take is to have antivirus software installed, and to have it run scans regularly.

How do I know I have a Logic Bomb?

A logic bomb is quite difficult to find if you are unaware you have one, but if files start to go missing, or your computer won’t let you log in, you may want to call an IT.
